

Abstract of the Disclosure

A bumper system for a loading dock includes an engagement member and a guide member mounted to the face of the dock. The guide member helps guide a vehicle toward the engagement member, which receives the primary impact of the vehicle backing into the dock. If the vehicle is excessively off to one side, the guide member of some embodiments may affect the operation of a dock leveler, vehicle restraint, dock seals, or a door associated with the loading dock. In some embodiments when the vehicle is off to one side the guide member may inhibit the vehicle from reaching the engagement member.
